Technology Components

- The application is designed for use by multiple users and groups of users in an Organization. Only a web browser is required to access the complete application.
- This ability uses the following components:

Web and DATABASE Application development tools

- PL-SQL
- HTML
- Java Script
- XML
- Flesh

HTMLDB - The HTMLDB engine renders applications in real time from data stored in DBMS tables. Metadata is stored in database tables. When the application is run, the engine reads the metadata and displays the application.

Security – The application takes full advantage of the Oracle Database’s industry-leading security.

Web Application Server – Apache HTTP server which integrated with ORACLE Technology

Boosting Operating Performance

Technology Overview

Accessing cME via Desktop / Tablet PC

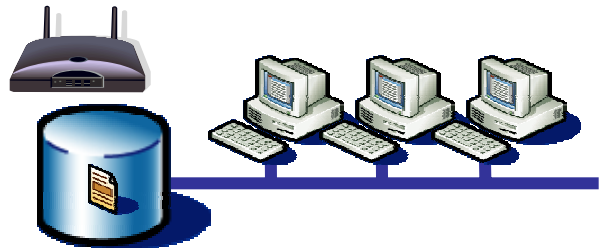

The Technology

- The technology we use enables full and reliable information management using a 100% multi-tier WEB Architecture.
- The environment portability across all major platforms (Unix, Windows, Linux, etc) enables the application to run without modification after changing platforms.
- The Architecture designed to ensure implementation flexibility to the industry needs to support the known implementation methods:
 - **Single site** – Enables installation at customer's single site with one business entity set of data
 - **Multi site** – Enables for multi sites customers to install Central system with separated set of data for each site.
 - **Hosting services** – All customers have the option to use our Hosting services in order to minimize the TCO (Technology Cost of Ownership).

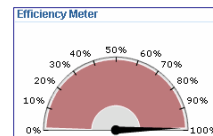

- 1 QA Techs Record shift activities: audits / clearances / action items (PC / Tablet PC)

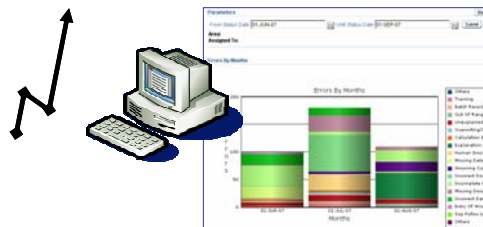

- 2 QA Techs Record BR Data / Errors report sent to Mfg./Pkg. / Other QA Activities

- 3 End of Shift: Review Activities, Efficiency and Cycle time

- 4 Managers, Lean / Sigma Teams and Executives Monitoring, Planning and Reports
